

Dart Task 1

You are required to build a Dart console application that collects user data, generates a username, calculates age, and provides an interactive menu system.

Requirements:

1. Ask user to enter first name, last name, and birth year.
2. Calculate the user's age using the current year (2026).
3. Validate age using assert (age must be greater than 0).
4. Generate username using: first 2 letters of first name + first 2 letters of last name capitalized + last 2 numbers in birth year, EX: AHA109
5. Clean input.
6. Ask the user to enter a username to compare the generated username. Use `compareTo()` to check whether the two usernames are equal. If they are equal, print a warning message.
7. Validate the generated username using a regular expression (RegExp). The username must follow the required format: 4 letters followed by 2 digits (e.g., AHA109). Print whether the username is valid or invalid.
8. Classify user as Adult or Minor based on age.
9. Assign access level (Full | Limited) using switch statement.
10. Create a menu loop that keeps running until the user chooses Exit.
11. Menu options: Show user info, Check age category, Show username, Exit.

Important Note: The program should continuously display a menu and allow the user to choose different options without restarting the program. It should only exit when the user selects option 4
